

## HIGH PERFORMANCE CURRENT MODE PWM CONTROLLER

NOT FOR NEW DESIGN

### 1 FEATURES

- TRIMMED OSCILLATOR DISCHARGE CURRENT
- CURRENT MODE OPERATION TO 500kHz  
AUTOMATIC FEED FORWARD  
COMPENSATION
- LATCHING PWM FOR CYCLE-BY-CYCLE  
CURRENT LIMITING
- INTERNALLY TRIMMED REFERENCE WITH  
UNDERVOLTAGE LOCKOUT
- HIGH CURRENT TOTEM POLE OUTPUT  
UNDERVOLTAGE LOCKOUT WITH  
HYSTERESIS
- LOW START-UP CURRENT (< 0.5mA)  
DOUBLE PULSE SUPPRESSION

### 2 DESCRIPTION

The UC384xA family of control ICs provides the necessary features to implement off-line or DC to DC fixed frequency current mode control schemes with a minimal external parts count. Internally implemented circuits include a trimmed oscillator for precise DUTY CYCLE CONTROL under voltage lockout featuring start-up current less than 0.5mA, a precision reference trimmed for accuracy at the error amp input, logic to insure latched operation, a PWM comparator which also provides current limit control, and a totem pole output stage designed to source or sink high peak current. The output stage, suitable for driving N-Channel MOSFETs, is low in the off-state.

Differences between members of this family are the under-voltage lockout thresholds and maximum duty cycle ranges. The UC3842A and UC3844A have UVLO thresholds of 16V (on) and 10V (off), ideally suited off-line applications. The corresponding thresholds for the UC3843A and UC3845A are 8.5 V and 7.9V. The UC3842A and UC3843A can operate to duty cycles approaching 100%. A range of the zero to < 50 % is obtained by the UC3844A and UC3845A by the addition of an internal toggle flip flop which blanks the output off every other clock cycle.

**Table 3. Pin Description**

N°	Pin	Function
1	COMP	This pin is the Error Amplifier output and is made available for loop compensation.
2	$V_{FB}$	This is the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	$I_{SENSE}$	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	$R_T/C_T$	The oscillator frequency and maximum Output duty cycle are programmed by connecting resistor $R_T$ to $V_{ref}$ and capacitor $C_T$ to ground. Operation to 500kHz is possible.
5	GROUND	This pin is the combined control circuitry and power ground.
6	OUTPUT	This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin.
7	$V_{CC}$	This pin is the positive supply of the control IC.
8	$V_{ref}$	This is the reference output. It provides charging current for capacitor $C_T$ through resistor $R_T$ .

Notes: 1. Max package power dissipation limits must be respected; low duty cycle pulse techniques are used during test maintain T<sub>j</sub> as close to T<sub>amb</sub> as possible.

2. These parameters, although guaranteed, are not 100% tested in production.
3. Parameter measured at trip point of latch with V<sub>PIN2</sub> = 0.
4. Gain defined as :  $A = \Delta V_{PIN1} / \Delta V_{PIN3}$ ;  $0 \leq V_{PIN3} \leq 0.8\text{V}$
5. Adjust V<sub>i</sub> above the start threshold before setting at 15 V.

Figure 4. Open Loop Test Circuit.

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5 KΩ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.
