General Description

The HMC415LP3 & HMC415LP3E are high efficiency GaAs InGaP Heterojunction Bipolar Transistor (HBT) MMIC Power amplifiers which operate between 4.9 and 5.9 GHz. The amplifier is packaged in a low cost, leadless surface mount package with an exposed base for improved RF and thermal performance. With a minimum of external components, the amplifier provides 20 dB of gain, +26 dBm of saturated power, and 34% PAE from a +3V supply voltage. Vpd can be used for full power down or RF output power/current control. For +15 dBm OFDM output power (64 QAM, 54 Mbps), the HMC415LP3 & HMC415LP3E achieve an error vector magnitude (EVM) of 3.7% meeting 802.11a linearity requirements.

Electrical Specifications, $T_A = +25^\circ C$, $V_s = 3V$, $V_{pd} = 3V$

Pin Descriptions

Pin Number	Function	Description	Interface Schematic
1	Vcc	Power supply voltage for the first amplifier stage. An external bypass capacitor of 330 pF is required as shown in the application schematic.	
2, 3, 5, 6, 7, 8, 9, 12, 13, 15, 16	GND	Ground: Backside of package has exposed metal ground slug that must be connected to ground thru a short path. Vias under the device are required.	
4	RFIN	This pin is AC coupled and matched to 50 Ohms from 5.0 to 6.0 GHz.	
10, 11	RFOUT	RF output and DC bias for the output stage.	
14	Vpd	Power control pin. For maximum power, this pin should be connected to 3.0V. A higher voltage is not recommended. For lower idle current, this voltage can be reduced.

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation board should be mounted to an appropriate heat sink. The evaluation circuit board shown is available from Hittite upon request.
